ABSTRACT

In this paper, we introduce three weaker forms of locally closed sets called PGPRW-LC sets, PGPRW-LC\* set and PGPRW-LC\*\* sets each of which is weaker than locally closed set and study some of their properties and their relationships with W-LC,  $\theta$ g-lc, G-LC and RG-LC sets.

**Keywords:** pgprw-closed sets, pgprw-open sets, locally closed sets, pgprw-locally closed sets.

**Mathematics subject classification (2010):** 54A05.

1. INTRODUCTION

Bourbaki[1] defined a subset of a topological space to be locally closed set if it is the intersection of an open set and a closed. Stone[2] has used the term FG for locally closed set and study some of their properties and their relationships with W-LC,  $\theta$ g-lc, G-LC, and RG-LC sets.

2. PRELIMINARIES

A subset A of t.s (X, T) is called a

- (i) Locally closed (briefly LC) set[3] if  $A=U \cap F$ , where U is open and F is closed in X.
- (ii) a pre generalized pre regular weakly closed set[4] (briefly pgprw-closed set) if  $pCl(A) \subseteq U$  whenever  $A \subseteq U$  and U is  $\text{rg}\alpha$ -open in (X,  $\tau$ ).
- (iii) pre generalized pre regular weakly open set if  $A^c$  is a [5] pgprw closed.
- (iv)  $\theta$ g-lc set[6] if  $A=U \cap F$ , where U is  $\theta$ g-open and F is  $\theta$ g-closed in X.
- (v)  $\theta$ g-lc\* set[6] if  $A=U \cap F$ , where U is  $\theta$ g-open and F is closed in X.
- (vi)  $\theta$ g-lc\*\* set [6] if  $A=U \cap F$ , where U is open and F is  $\theta$ g-closed in X.
- (vii) G-LC set if  $A=U \cap F$ [7] where U is g-open and F is g-closed in X.
- (viii) G-LC\* set if  $A=U \cap F$ [7] where U is g-open and F is closed in X.
- (ix) G-LC\*\* set if  $A=U \cap F$ [7] where U is open and F is g-closed in X.
- (x) W-LC set if  $A=U \cap F$ [8] where U is w-open and F is w-closed in X.
- (xi) W-LC\* set if  $A=U \cap F$ [8] where U is w-open and F is closed in X.
- (xii) W-LC\*\* set if  $A=U \cap F$ [8] where U is open and F is w-closed in X.
- (xiii) RG-LC set if  $A=U \cap F$ [9] where U is rg-open and F is rg-closed in X.
- (xiv) RG-LC\* set if  $A=U \cap F$ [9] where U is rg-open and F is closed in X.
- (xv) RG-LC\*\* set if  $A=U \cap F$ [9] where U is open and F is rg-closed in X.
- (xvi)  $\text{l}\delta$ g-lc set if  $A=U \cap F$ [10] where U is  $\text{l}\delta$ g-open and F is  $\text{l}\delta$ g-closed in X.
- (xvii)  $\text{l}\delta$ g-lc\* set if  $A=U \cap F$ [10] where U is  $\text{l}\delta$ g-open and F is closed in X.
- (xviii)  $\text{l}\delta$ g-lc\*\* set if  $A=U \cap F$ [10] where U is open and F is  $\text{l}\delta$ g-closed in X.

**Theorem 2.1:**[4]

- (i) Every closed set is pgprw-closed set.

### 3. Pgprw-LOCALLY CLOSED SETS IN TOPOLOGICAL SPACES

**Definition 3.1:** A Subset A of t.s (X,T) is called pgprw-locally closed (briefly PGPRW-LC).

if  $A=U\cap F$  where U is pgprw-open in (X,T) and F is pgprw-closed in (X,T).The set of all pgprw-locally closed sets of (X,T) is denoted by PGPRW-LC(X,T).

**Example 3.2:** Let  $X=\{a, b, c, d\}$  and  $T=\{X, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$

$Pgprwc(X,T)=\{X, \emptyset, \{c\}, \{d\}, \{a,d\}, \{b,d\}, \{c,d\}, \{a,c,d\}, \{b,c,d\}, \{a,b,d\}\}$ .

$PGPRW-LC-Set = \{X, \emptyset, \{a\}, \{b\}, \{c\}, \{d\}, \{a,b\}, \{a,c\}, \{a,d\}, \{b,c\}, \{b,d\}, \{c,d\}, \{a,b,c\}, \{a,b,d\}, \{b,c,d\}, \{a,c,d\}\}$ .

**Remark 3.3:** The following are well known

- (i) A Subset A of (X,T) is PGPRW-LC set iff it's complement  $X-A$  is the union of a pgprw-open set and a pgprw-closed set.
- (ii) Every pgprw-open (resp. Pgprw-closed ) subset of (X,T) is a PGPRW-LC set.

**Theorem 3.4:** Every locally closed set is a PGPRW-LC set but not conversely.

**Proof:** The proof follows from the two defintions[follows from theorem 2.1] and fact that every closed (resp.open) set is pgprw-closed (pgprw-open).

**Example 3.5:** Let  $X=\{a,b,c,d\}$  and  $T=\{X, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$  then  $\{b,c\}$  is PGPRW-LC but not a locally closed set in (X,T).

**Remark 3.6:**  $l\delta_{gc}$ -sets and PGPRW-LC sets are independent of each other as seen from the following example

**Example 3.7:**

- (i) Let  $X=\{a,b,c\}$  and  $T=\{X, \emptyset, \{a\}, \{b,c\}\}$  then  $\{b\}$  is  $l\delta_{gc}$ -lc but not PGPRW-LC set in (X,T).
- (ii) Let  $X=\{a,b,c\}$  and  $T=\{X, \emptyset, \{a\}, \{b\}, \{a,c\}\}$  then  $\{b\}$  is PGPRW-LC but not  $l\delta_{gc}$ -lc set in (X,T).

**Remark 3.8:**  $\theta$ -g lc sets and PGPRW-LC sets are independent of each other as seen from the following example

**Example:** Let  $X=\{a,b,c\}$  and  $T=\{X, \emptyset, \{a\}, \{b,c\}\}$  then  $\{c\}$  is  $\theta$ -g -lc but not PGPRW-LC set in (X,T).

**Example:** Let  $X=\{a,b,c\}$  and  $T=\{X, \emptyset, \{a\}, \{b\}, \{a,c\}\}$  then  $\{b\}$  is PGPRW-LC but not  $\theta$ -g-lc set in (X,T).

**Definition 3.9:** A subset A of (X,T) is called a PGPRW-LC\* set if there exists a pgprw-open set G and a closed F of (X,T) s.t  $A=G\cap F$  the collection of all PGPRW-LC\* sets of (X,T) will be denoted by PGPRW-LC\*(X,T).

**Definition 3.10:** A subset B of (X,T) is called a PGPRW-LC\*\* set if there exists an open set G and pgprw closed set F of (X,T) s.t  $B=G\cap F$  the collection of all PGPRW-LC\*\* sets of (X,T) will be denoted by PGPRW-LC\*\*(X,T).

From the above definition we have the following results.

**Theorem 3.11:**

- (i) Every locally closed set is a PGPRW-LC\* set.
- (ii) Every locally closed set is a PGPRW-LC\*\* set.
- (iii) Every PGPRW-LC\* set is PGPRW-LC set
- (iv) Every PGPRW-LC\*\* set is PGPRW-LC set

**Proof:** The proof are obvious from the definition and the relation between the sets however the converses of the above results are not true as seen from the following examples.

**Example 3.12:** Let  $X=\{a,b,c,d\}$  and  $T=\{X, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$

- (i) The set  $\{c\}$  is PGPRW-LC\* set but not a locally closed set in (X,T).
- (ii) The set  $\{b,c\}$  is PGPRW-LC\*\* set but not a locally closed set in (X,T).
- (iii) The set  $\{a,d\}$  is PGPRW-LCset but not a PGPRW-LC\* set in (X,T).
- (iv) The set  $\{b,c\}$  is PGPRW-LCset but not a PGPRW-LC\*\* set in (X,T).

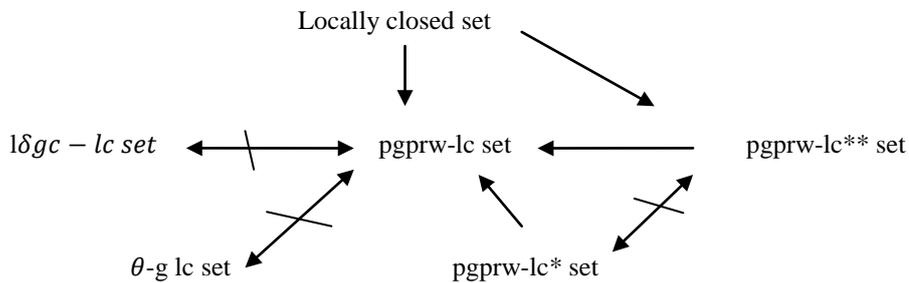

**Remark 3.13:** PGPRW-LC\* sets and PGPRW-LC\*\* sets are independent of each other as seen from the examples.

**Example:** Let  $X=\{a,b,c\}$  and  $T =\{X, \emptyset, \{a\}, \{a,b\}\}$  then the set  $\{b\}$  is PGPRW-LC\*\* but not PGPRW-LC\* set in  $(X,T)$ .

**Example:** Let  $X=\{a,b,c\}$  and  $T =\{X, \emptyset, \{a\}, \{a,b\}\}$  then the set  $\{a,c\}$  is PGPRW-LC\* but not PGPRW – LC\*\* set in  $(X,T)$ .

**Remark 3.14:** From the above discussion and known results we have the following implication.

In the diagram

**Theorem 3.15:** If  $pgprwo(X,T)$  then

- (i)  $PGPRW-LC(X,T) = LC(X,T)$ .

**Proof:** (i) For any space  $(X,T)$ , w.k.t  $LC(X,T) \subseteq PGPRW-LC(X,T)$ . Since  $PGPRWO(X,T)=T$ , that is every pgprw-open set is open and every pgprw-closed set is closed in  $(X,T)$ ,  $PGPRW-LC(X,T) \subseteq LC(X,T)$ ; hence  $PGPRW-LC(X,T) = LC(X,T)$ .

**Theorem 3.16:** If  $PGPRWO(X,T) = T$ , then  $PGPRW-LC^*(X,T) = PGPRW-LC^{**}(X,T) = PGPRW-LC(X,T)$ .

**Proof:** for any space,  $(X,T)$

$$LC(X,T) \subseteq PGPRW-LC^*(X,T) \subseteq PGPRW-LC(X,T) \text{ and}$$

$$LC(X,T) \subseteq PGPRW-LC^{**}(X,T) \subseteq PGPRW-LC(X,T) \text{ since } PGPRWO(X,T)=T.$$

$PGPRW-LC(X,T)=LC(X,T)$  by theorem 3.15, it follows that

$$LC(X,T)=PGPRW-LC^*(X,T) = PGPRW-LC^{**}(X,T)= PGPRW-LC(X,T).$$

**Remark 3.17:** The converse of the theorem 3.16 need not be true in general as seen from the following example.

**Theorem 3.18:** Let  $X=\{a,b,c\}$  with the topology  $T= \{X, \emptyset, \{a\}, \{b\}, \{a,c\}\}$  then  $PGPRW-LC^*(X,T)=PGPRW-LC^{**}(X,T)=PGPRW-LC(X,T)=P(X)$ .

However  $PGPRWO(X,T)=\{X, \emptyset, \{a\}, \{b\}, \{c\}, \{a,b\}, \{b,c\}, \{a,c\}\} \neq T$ .

**Theorem 3.19:** If  $GO(X,T)=T$ , then  $GLC(X,T) \subseteq PGPRW-LC(X,T)$

**Proof:** For any space  $(X,T)$  w.k.t  $LC(X,T) \subseteq GLC(X,T)$  and  $LC(X,T) \subseteq PGPRW-LC(X,T)$ ,.....(i)

$GO(X,T)=T$ , that is every g-open set is open and every g-closed set is closed in  $(X,T)$  and so

$$GLC(X,T) \subseteq LC(X,T) \text{ that is } GLC(X,T) = LC(X,T), \dots \dots (ii)$$

From (i) and (ii) we have  $GLC(X,T) \subseteq PGPRW-LC(X,T)$ .

**Theorem 3.20:** If  $PGPRW-LC(X,T) \subseteq LC(X,T)$ . For any space  $(X,T)$ , then  $PGPRW-LC(X,T) = PGPRW-LC^*(X,T)$

**Proof:** Let  $PGPRWC(X,T) \subseteq LC(X,T)$ , For any space  $(X,T)$ , w.k.t  $PGPRW-LC^*(X,T) \subseteq PGPRW-LC(X,T)$ ... (i) Let  $A \in pgprwc(X,T)$ , then  $A = U \cap F$ , where  $U$  is pgprw-open and  $F$  is a pgprw-closed in  $(X,T)$ . Now,  $F \in PGPRW-LC(X,T)$  by hypothesis  $F$  is locally closed set in  $(X,T)$ , then  $F = G \cap E$ , where  $G$  is an open set and  $E$  is a closed set in  $(X,T)$ . Now,  $A = U \cap F = U \cap (G \cap E) = (U \cap G) \cap E$ , where  $U \cap G$  is pgprw-open as the intersection of pgprw-open sets is pgprw-open and  $E$  is a closed set in  $(X,T)$ . It follows that  $A$  is  $PGPRW-LC^*(X,T)$ . That is  $A \in PGPRW-LC^*(X,T)$  and so,  $PGPRWC(X,T) \subseteq PGPRW-LC^*(X,T)$  .....(ii).

From (i) and (ii) we have  $PGPRW-LC(X,T) = PGPRW-LC^*(X,T)$ .

**Example 3.21:** The converse of the theorem 3.20 need not be true in general as seen from the following example.

**Example 3.22:** Consider  $X = \{a,b,c,d\}$  and  $T = \{X, \emptyset, \{a,b\}, \{c,d\}\}$ , then  $PGPRW-LC(X,T) = PGPRW-LC^*(X,T) = P(X)$ . But  $PGPRWC(X,T) = P(X)$  and  $LC(X,T) = \{X, \emptyset, \{a,b\}, \{c,d\}\}$  That is  $pgprwc(X,T) \not\subseteq LC(X,T)$ .

**Theorem 3.23:** For a subset  $A$  of  $(X,T)$  if  $A \in PGPRW-LC(X,T)$  then  $A = U \cap (pgprw-cl(A))$  for some open set  $U$ .

**Proof :** Let,  $A \in PGPRW-LC(X,T)$  then there exist a  $pgprw$ -open  $U$  and a  $pgprw$ -closed set  $F$  s.t.  $A = U \cap F$ . Since  $A \subseteq F$ ,  $pgprw-cl(A) = pgprw-cl(F) = F$ . Now  $U \cap (pgprw-cl(A)) \subseteq U \cap F = A$ , that is  $U \cap (pgprw-cl(A)) = A$ .

Conversely  $A \subseteq U$  and  $A \subseteq pgprw-cl(A)$  implies  $A \subseteq U \cap (pgprw-cl(A))$  and therefore  $A = U \cap (pgprw-cl(A))$  for some  $pgprw$ -open set  $U$ .

**Remark 3.24:** The converse of the theorem 3.23 need not be true in general as seen from the following example.

**Example 3.25:** Consider  $X = \{a,b,c\}$  with the topology  $T = \{X, \emptyset, \{a\}, \{b,c\}\}$  then

$pgprwc(X,T) = \{X, \emptyset, \{a\}, \{b,c\}\}$  then  $PGPRW-LC(X,T) = \{X, \emptyset, \{a\}, \{b,c\}\}$

Take  $A = \{b\}$ ,  $pgprw-cl(A) = \{b,c\}$  now,  $A = X \cap (pgprw-cl(A))$  for some  $pgprw$ -open set  $X$ . but  $\{b\} \notin PGPRW-LC(X,T)$ .

**Theorem 3.26:** For a subset  $A$  of  $(X,T)$ , the following are equivalent.

- (i)  $A \in PGPRW-LC^*(X,T)$ .
- (ii)  $A = U \cap (p-cl(A))$  for some  $pgprw$ -open set  $U$ .
- (iii)  $pcl(A) - A$  is  $pgprw$ -closed.
- (iv)  $A \cup (p-cl(A))^c$  is  $pgprw$ -open.

**Proof :**

- (i) implies (ii) Let  $A \in PGPRW-LC^*(X,T)$  then there exists a  $pgprw$ -open set  $U$  and a closed set  $F$  s.t.  $A = U \cap F$ . Since  $A \subseteq F$ ,  $p-cl(A) \subseteq p-cl(F) = F$ . Now  $U \cap p-cl(A) \subseteq U \cap F = A$  that is  $U \cap p-cl(A) = A$ . Conversely  $A \subseteq U$ , and  $A \subseteq p-cl(A)$  implies  $A \subseteq U \cap p-cl(A)$  and therefore  $A = U \cap p-cl(A)$  for some  $pgprw$ -open set  $U$ .
- (ii) implies (i) since  $U$  is a  $pgprw$ -open set and  $pcl(A)$  is a closed set,  $A = U \cap (p-cl(A)) \in PGPRW-LC^*(X,T)$ .
- (iii) implies (iv) let  $F = p-cl(A) - A$ , then  $F$  is  $pgprw$ -closed by the assumption and  $X - F = X - [p-cl(A) - A] = X \cap [p-cl(A) - A]^c = A \cup (X - p-cl(A)) = A \cup (p-cl(A))^c$ . But  $X - F$  is  $pgprw$ -open. This shows that  $A \cup (p-cl(A))^c$  is  $pgprw$ -open.
- (iv) implies (iii) Let  $U = A \cup (p-cl(A))^c$  then  $U$  is  $pgprw$ -open, this implies  $X - U$  is  $pgprw$ -closed and  $X - U = X - (A \cup (p-cl(A))^c) = p-cl(A) \cap (X - A) = p-cl(A) - A$  is  $pgprw$ -closed.
- (v) implies (ii) Let  $U = A \cup (p-cl(A))^c$  then  $U$  is  $pgprw$ -open. hence we prove that  $A = U \cap (p-cl(A))$  for some  $pgprw$ -open set  $U$ .

Now  $A = U \cap (p-cl(A))$   
 $= [A \cup (p-cl(A))^c] \cap p-cl(A)$   
 $= A \cap [p-cl(A)] \cup p-cl(A) \cap p-cl(A)$   
 $= A \cup \emptyset = A$ . Therefore  $A = U \cap (p-cl(A))$  for some  $pgprw$ -open set  $U$ .

(ii) implies (iv) Let  $A = U \cap (p-cl(A))$  for some  $pgprw$ -open set then we p.t  $A \cup (p-cl(A))^c$  is  $pgprw$ -open. Now  $A \cup (p-cl(A))^c = (U \cap (p-cl(A))) \cup [p-cl(A)]^c = U \cap (p-cl(A)) \cup [p-cl(A)]^c = U \cap X = U$ , which is  $pgprw$ -open. Thus  $A = (p-cl(A))^c$  is  $pgprw$ -open.

**Theorem 3.27:** For a subset  $A$  of  $(X,T)$  if  $A \in PGPRW-LC^{**}(X,T)$ , then there exists an open set  $U$  s.t.  $A = U \cap pgprw-cl(A)$ .

**Proof:** Let  $A \in PGPRW-LC^{**}(X,T)$ , then there exist an open set  $U$  and a  $pgprw$ -closed set s.t.  $A = U \cap F$  Since  $A \subseteq U$  and  $A \subseteq pgprw-cl(A)$  we have  $A \subseteq pgprw-cl(A)$ .

Conversely, Since  $A \subseteq F$  and  $pgprw-cl(A) \subseteq pgprw-cl(F) = F$ , as  $F$  is  $pgprw$ -closed. Thus  $U \cap pgprw-cl(A) \subseteq U \cap F = A$ . That is  $U \cap pgprw-cl(A) \subseteq A$ ; hence  $A = U \cap pgprw-cl(A)$ . For some open set  $U$ .

**Theorem 3.28:** The converse of the theorem 3.27 need not be true in general as seen from the following example.

**Example:** Let  $X = \{a, b, c, d\}$  with the topology  $T = \{X, \emptyset, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$  take  $A = \{a, d\}$ .

Then  $\text{pgprw-cl}(A) = \text{pgprw-cl}\{a, d\} = \{a, d\}$ ; also  $A = X \cap \text{pgprw-cl}(A) = \{a, b, c, d\} \cap \{a, d\} = \{a, d\}$  for some open set  $X$  but  $\{a, d\} \notin \text{PGPRW-LC}^{**}(X, T)$ .

**Theorem 3.29:** For  $A$  and  $B$  in  $(X, T)$  the following are true.

- (i) if  $A \in \text{PGPRW-LC}^*(X, T)$  and  $B \in \text{PGPRW-LC}^*(X, T)$ , then  $A \cap B \in \text{PGPRW-LC}^*(X, T)$ .
- (ii) if  $A \in \text{PGPRW-LC}^{**}(X, T)$  and  $B$  is open, then  $A \cap B \in \text{PGPRW-LC}^{**}(X, T)$ .
- (iii) if  $A \in \text{PGPRW-LC}(X, T)$  and  $B$  is pgprw-open, then  $A \cap B \in \text{PGPRW-LC}(X, T)$ .
- (iv) if  $A \in \text{PGPRW-LC}^*(X, T)$  and  $B$  is pgprw-open, then  $A \cap B \in \text{PGPRW-LC}^*(X, T)$ .
- (v) if  $A \in \text{PGPRW-LC}^*(X, T)$  and  $B$  is closed, then  $A \cap B \in \text{PGPRW-LC}^*(X, T)$ .

**Proof:**

- (i) Let  $A, B \in \text{PGPRW-LC}^*(X, T)$ , it follows from theorem 3.26 that there exist pgprw-open sets  $P$  and  $Q$  s.t  $A = P \cap P\text{-cl}(A)$  and  $B = Q \cap P\text{-cl}(B)$ . Therefore  $A \cap B = P \cap P\text{-cl}(A) \cap Q \cap P\text{-cl}(B) = P \cap Q \cap [P\text{-cl}(A) \cap P\text{-cl}(B)]$  where  $P \cap Q$  is pgprw-open and  $P\text{-cl}(A) \cap P\text{-cl}(B)$  is closed. This shows that  $A \cap B \in \text{PGPRW-LC}^*(X, T)$ .
- (ii) Let  $A \in \text{PGPRW-LC}^{**}(X, T)$  and  $B$  is open. Then there exist an open set  $P$  and pgprw-closed set  $F$  s.t  $A = P \cap F$ . Now,  $A \cap B = P \cap F \cap B = (P \cap B) \cap F$ , Where  $(P \cap B)$  is open and  $F$  is pgprw-closed. This implies  $A \cap B \in \text{PGPRW-LC}^{**}(X, T)$ .
- (iii) Let  $A \in \text{PGPRW-LC}(X, T)$  and  $B$  is pgprw-open then there exists a pgprw-open set  $P$  and  $Q$  pgprw-closed set  $F$  s.t  $A = P \cap F$ . Now,  $A \cap B = P \cap F \cap B = (P \cap B) \cap F$ , Where  $(P \cap B)$  is pgprw-open and  $F$  is pgprw-closed. This shows that  $A \cap B \in \text{PGPRW-LC}(X, T)$ .
- (iv) Let  $A \in \text{PGPRW-LC}^*(X, T)$  and  $B$  is pgprw-open then there exists a pgprw-open set  $p$  and  $Q$  pgprw-closed set  $F$  s.t  $A = P \cap F$ . Now,  $A \cap B = (P \cap F) \cap B = (P \cap B) \cap F$ , Where  $(P \cap B)$  is pgprw-open and  $F$  is closed. This implies that  $A \cap B \in \text{PGPRW-LC}^*(X, T)$ .
- (v)  $A \in \text{PGPRW-LC}^*(X, T)$  and  $B$  is closed. Then there exist an pgprw-open set  $P$  and a closed set  $F$  s.t  $A = P \cap F$ . Now,  $A \cap B = (P \cap F) \cap B = P \cap (F \cap B)$ , Where  $(F \cap B)$  is closed and  $p$  is pgprw-open. This implies  $A \cap B \in \text{PGPRW-LC}^*(X, T)$ .
