“FIELD VISIT”

DEVAR GENNUR

2016-2017

List of Participants

S.No	Name of Students	Signature
1	Pooja B	
2	Deepa Jevoor	
3	Sunil Bajantri	
4	Kavita Math	
5	Prasad Karne	
6	Meenaxi Koshti	
7	Saurab Hosur	
8	Shruti Honawada	
9	Anil Jadav	
10	Anita Biradar	
11	Savita Hoogar	
12	Nagesh Metri	
13	Saleem Jamakandi	
14	Rekha Itagi	
15	Sagar Alegon	
16	Triveni	
17	Pooja Hanji	
18	Shoba Patil	
19	Arun Jorapur	
20	Sarala Patil	
Staff Members		
1	Dr.M.I.Kumbar	
2	Dr.M.S.Yadawe	
3	Dr.A.S.Pujar	
4	Dr.U.S.Pujeri	
5	Dr.S.C.Hiremath

OBJECTIVES

Soil and Water Testing

Soil analysis is a set of various chemical processes that determine the amount of available plant nutrients in the soil, but also the chemical, physical and biological soil properties important for plant nutrition, or "soil health". Chemical soil analysis determines the content of basic plant nutrients; nitrogen (N), phosphorus (P_2O_5), potassium (K_2O), pH, humus content, organic matter, total sulphur (S), trace elements, and other physical characteristics (pH - value)

Evaluation of fertility status of soil

Estimation of the available nutrients status of soil

Evaluation of the suitability of soil for laying garden

Determination of acidity, salinity and alkalinity problems and

Recommendation of the required amount of fertilizers, lime or gypsum based on soil test value.

Irrigation water quality is a critical aspect of greenhouse crop production. There are many factors which determine water quality. Among the most important are alkalinity, pH and soluble salts. But there are several other factors to consider, such as whether hard water salts such as calcium and magnesium or heavy metals that can clog irrigation systems or individual toxic ions are present. In order to determine this, water must be tested at a laboratory that is equipped to test water for agricultural irrigation purposes.

Poor quality water can be responsible for slow growth, poor aesthetic quality of the crop and, in some cases, can result in the gradual death of the plants. High soluble salts can directly injure roots, interfering with water and nutrient uptake. Salts can accumulate in plant leaf margins, causing burning of the edges. Water with high alkalinity can adversely affect the pH of the growing medium, interfering with nutrient uptake and causing nutrient deficiencies which compromise plant health.

Students and Staff at Devar Gennur for field work

REPORT

B.L.D.E.A's S.B.Arts and K.C.P.Science College , Vijayapur , started an innovative programme to provide soil and water awareness to farmers in order to get good crop yields.

Under this program soil samples are collected on the spot and analysed as well. Based on the results farmers were recommended fertilizers and crop planning.

On 19/03/2017 students along with staff visited Devar Gennur .Over hundred soil samples were analysed and over 25 water samples were analysed.

Students examined the soil and water samples and explained it to the farmers. The nutrient values in the soil and water were analysed .

This field visit helped farmers in understanding the importance of soil and water testing. This visit helped farmers in understanding their soil and helped in identifying the right amount of fertilizer and crop. Also students realized the struggles of farmers.
