Mangifera indica

Scientific classification /

Kingdom: Plantae

Clade : Angiosperms

Order : Sapindales

Family : Anacardiaceae

Genus : Mangifera

Species : M. indica

Tree.

A large green tree, valued mainly for its fruits, both green and ripe. Approximately 210 varieties of mango have been reported. It can grow up to 15–30 metres (49–98 ft) tall. The tree grows best in well-drained sandy loam; it does not grow well in heavy wet soils. The optimal pH of the soil should be between 5.2 and 7.5

Flowers

Flowers appear at the end of winter and beginning of spring. Both male and female flowers are borne on same tree. The Climatic conditions have significant influence on the time of flowering of mango. In India, flowering starts in December in the South, in January in Bihar and Bengal, in February in eastern Uttar Pradesh, and in February–March in northern India. The duration of flowering is 20–25 days in Dashehari, while panicle emergence occurs in early December and flower opening is completed by February. The Neelum variety of mango produces two crops a year in Kanyakumari, in South India, but it flowers only once in North Indian condition.

Fruits

The mango is an irregular, egg-shaped fruit which is a fleshy drupe. Mangos are typically 8–12 cm (3–5 in) long and greenish yellow in color. The fruits can be round, <u>oval</u>, heart, or kidney shaped. Mango fruits are green when they are unripe. The interior flesh is bright orange and soft with a large, flat pit in the middle. Mangos are mature in April and May. Raw mangos can be used in the making of <u>pickles</u> and <u>chutneys</u>. Ripe mangos are a popular fruit throughout
